

AI-Powered Development in 15 Minutes

What it is, where it lives, and why it matters for your team.

Let's get started →

15 min · 10 slides

What Is GitHub Copilot?

What It Does

- Writes code — real-time suggestions as developers type
- Answers questions — conversational AI that understands your codebase
- Reviews code — automated PR analysis with actionable feedback

Business Impact

- 55% faster task completion (GitHub research)
- Reduces friction on the 60-70% of work that's mechanical
- Integrates into existing tools — no workflow disruption

Three Surfaces, One AI

VS Code

Your editor — where code gets written

Completions · Chat · Agent Mode

GitHub CLI

Your terminal — where commands run

Interactive Chat · Automation · Scripts

GitHub.com

Your platform — where teams collaborate

Code Review · PR Chat · Cloud Agent

Key insight: Same AI, different entry points. Copilot meets your team where they already work — no new tools to learn, no context switching.

Surface 1: VS Code

⚡ Code Completions

Ghost text appears as you type — Tab to accept

Single lines to entire functions — infers intent from context

Pattern continuation — write one example, it follows for the rest

💬 Copilot Chat

Ask questions about your codebase in natural language

Debug, refactor, explain — conversational, not just autocomplete

🤖 Agent Mode

Autonomous execution — plans, implements, and iterates

Multi-file edits — creates, modifies files across the project

Runs terminal commands — build, test, lint automatically

Self-corrects — detects errors and fixes without intervention

💡 For teams: Agent mode turns a feature request into a working PR — developers describe *what*, Copilot handles *how*.

Surface 2: GitHub CLI

AI in Your Terminal

Full conversational AI — right where commands run. Interactive sessions or single-shot automation.

```
# Start an interactive session
$ copilot
> "Why did the build fail?"
> "Fix the failing test in auth.spec.ts"
```

```
# Single-shot for scripts & CI
$ copilot -p "Create a migration to add
a status column to the orders table" \
--allow-tool 'shell(command)'
```

Why It Matters

No context switching — stay in the terminal, ask naturally

Reads your codebase — understands project structure and files

Runs commands — executes shell commands with your approval

Plan mode — press Shift+Tab to plan before coding

💡 For teams: CLI sessions can be scripted into CI/CD pipelines — AI-assisted automation at scale.

Surface 3: GitHub.com

Copilot Code Review

 Logic errors & edge cases

 Security vulnerabilities (SQL injection, XSS)

 Performance issues (N+1 queries, memory leaks)

 Inline suggestions with fix-it code diffs

 Copilot handles mechanical checks so human reviewers focus on architecture and design.

Copilot Cloud Agent

Assign an issue to Copilot on GitHub.com

Copilot creates a PR — branch, code, tests, docs

Team reviews normally — human approval still required

Best for: well-defined tasks, bug fixes, feature additions

Copilot Chat on PRs

Ask Copilot questions directly in PR comments — summarize changes, explain code, suggest improvements.

How It All Fits Together

VS Code

Writing & building code
Completions · Chat · Agent

GitHub CLI

Terminal & automation
Interactive · Scripted · CI/CD

GitHub.com

Review & collaboration
Code Review · Cloud Agent

✓ The Developer Workflow

Write code in VS Code with Copilot → commit & push → Copilot reviews the PR on GitHub.com → fix issues via CLI or editor → merge with confidence.

🎯 The Key Principle

More context = better results. The same AI powers every surface. What changes is the context each one provides.

Customization: Teaching Copilot Your Patterns

Out of the box, Copilot knows general programming. With customization, it knows **your team's** programming.

Instructions

Team conventions applied to every response

Prompt Templates

Reusable, shareable prompt files

Custom Agents

Role-based AI specialists for your workflows

MCP Servers

Connect to databases, APIs, external tools

Without Customization

"Create a user endpoint" → Generic REST boilerplate that doesn't match your patterns

With Customization

"Create a user endpoint" → Follows your error handling, auth patterns, naming conventions, and queries your DB schema

💡 5 minutes to set up — one markdown file transforms every Copilot interaction from generic to team-specific.

Getting Started

Today

- Enable Copilot in your GitHub org settings
- Install the Copilot extension in VS Code
- Try Chat: `@workspace explain this project`

This Week

- Create `copilot-instructions.md` with team conventions
- Request Copilot Code Review on a PR
- Install the GitHub CLI `gh`
`copilot`

This Month

- Build prompt templates for recurring tasks
- Try the Cloud Agent on a well-defined issue
- Measure team adoption & time savings

 Start where your team already works. VS Code for developers. GitHub.com for reviewers. CLI for automation. Copilot is the same AI across all three.

 Thank You

Same AI. Three surfaces. Your team's context.
